<b>Scope :</b>	<p>The standard provides details on the identification of the main events of the urban construction site that generate noise, on preventive impact studies, on mitigation measures to be adopted, on the verifications, on compensative measures and information to citizens and on the most effective methods of monitoring .</p> <p>The standard applies to the urban environment, as this is the most common and significant situation of the construction site noise impact. The indications given in this standard may also be extended to non-urban land situations, but with building façade very close to the site activities.</p> <p>The standard does not address the effects of re-radiated noise (generated by vibration) for which please refer to UNI 9614.</p>

<b>Title :</b>	Determination of diffusive emissions by measurements - Quantification of diffusive emissions of fine dust from industrial plants including agricultural sources		
<b>Scope :</b>	This standard describes procedures for the determination and quantification of diffusively emitted particulate matter such as PM10 and PM2,5 from industrial plants including agricultural sources. It supplements and details the requirements of VDI 4285 Part 1 which specifies the general principles for the determination of diffusive emissions. Procedures for identification of sources and different approaches for determination of the emission rate of relevant diffusive sources are presented. Diffuse sources in the sense of this standard include industrial plants emitting particulate matter from non-conducted sources, which may arise e.g. from the exhaust air of an industrial hall in production processes or from the handling		

and transport of dust emitting materials. Furthermore, diffusive dust emissions may arise from agricultural sources such as big livestock farming or agriculturally treated areas. This guideline allows the analysis of the chemical speciation of these particles. It may be applied also to bioaerosols when direct methods are used. This standard is addressed to everyone involved in the planning, performance or evaluation of measurements for the determination of diffusively emitted particulate matter such as PM10 and PM2,5 from industrial plants including agricultural sources. The contents of this standard can be used as a reference by clients and contractors alike, for example, for formulating requirements and performance specifications for such investigations.

**Title :** Guidelines for the engineering and design of fully automated systems with rope traction for passenger transport  
**Scope :** The document is addressed at defining the procedural principles to use for reference when dealing with the engineering and preliminary design of fully automated transport systems, with rope traction, for passengers; these installations are usually recognisable in literature as APM (Automated People Movers). Transport systems with fixed installations and equipped with a control room are dealt with, which do not necessarily require the presence of staff, neither on vehicles nor at the stations; they are characterised by carriers - which operate on isolated runways, having a variable grade and layout - whose main traction is assigned to one or more rope loops and whose speed can be erased at the stations.  
 The aim of these guidelines is to try cover those peculiarities of services which are proper of transportation in urban contexts or in any highly anthropic area, therefore not for sport activities neither for recreational purposes, which are typical instead of transportation in mountains and at thematic or amusement parks.  
 In urban contexts, some standard aspects and technical features occur which are not always characteristic for the engineering and design of traditional rope installations or cableways; these were initially conceived for other environments.  
 Carrying of luggage, of baby carriages, the access for any genre of people - including those with ambulation difficulties - are involved.

<b>Title :</b>	Power cables with extruded insulation and their accessories for rated voltages above 36 kV (Um = 42 kV) up to 150 kV (Um = 170 kV). Part 1: Requirements and test methods		
<b>Scope :</b>	This standard specifies the test methods and requirements for power cables, only cables and only accessories, for fixed installations and rated voltages, U, exceeding 36 kV (Um = 42 kV) up to 150 kV (Um = 170 kV).		

The requirements of this standard apply to unipolar cables, tripolar cables with separate insulated conductors and to the accessories of both, under normal service and installation conditions, but not for special cables and their accessories such as submarine cables, for which it will be necessary to modify the tests of the standard or to devise special test conditions.

This standard does not cover joints between extruded insulated cables and cables with paper insulation.
