Title : Fire extinguishing systems in commercial kitchens - Design and test requirements.
Scope : The purpose and scope of this standard is to establish the minimum requirements that apply to the design, installation, operation, testing and maintenance of automatic fixed fire-extinguishing systems for the protection of commercial kitchens.

The protection includes both kitchen appliances such as the hood, plenum and extraction ducts.

Household kitchens or industrial food production equipment are not covered by this standard. However, under certain analogy conditions it could be used as a reference.

Likewise, the extinguishing tests are incorporated to verify their effectiveness in type homes that determine the limits of application of the system.

Title : Natural stones - Specific values for selection
Scope : This ÖNORM contains information on the most important technical properties of aggregates and solid rock, but not of rock in the sense of a vug body group. The values serve to compare the technical lithic characteristics and the selection to the given requirements. The specified bandwidths for the individual properties are values frequently used by tests. Deviations from these bandwidths are by unweathered rock material mostly because of a special formation of the relevant rock (eg mineral grain size), and do not necessarily mean the unfitness of this rock. Clause 5 contains the test procedure for the determination of these values. The respective requirements for the rocks can be found in the relevant standards.

| Title : | Standard Practice for Dealing With Outlying Observations | | |
| Scope : | This practice covers outlying observations in samples and how to test the statistical significance of them. An outlying observation, or outlier, is one that appears to deviate markedly from other members of the sample in which it occurs. In this connection, the following two alternatives are of interest: (i) an outlying observation may be merely an extreme manifestation of the random variability inherent in the data. If this is true, the value should be retained and processed in the same manner as the other observations in the sample. (ii) An outlying observation may be the result of gross deviation from prescribed | | |

experimental procedure or an error in calculating or recording the numerical value. In such cases, it may be desirable to institute an investigation to ascertain the reason for the aberrant value. The observation may even actually be rejected as a result of the investigation, though not necessarily so. At any rate, in subsequent data analysis, the outlier or outliers will be recognized as probably being from a different population than that of the other sample values. Recommended criteria and illustrations for single samples including the Dixon criteria which are based entirely on ratios of differences between the observations, criterion using independent standard deviation, and criterion for known standard deviation are presented.
