**Title :** Synthetic fuels - Fuels (class F) - Specification of Shale Oil

**Scope :** Estonian shale oil is a product, which is used as a liquid fuel or blended into motor fuels, produced from kukersiite oil shale by pyrolysis. Introduction of specification of Estonian shale oil is resulting from a need to define a product taking into account its specific properties. As liquid fuels are often blended together from different components and standard motor fuels need to meet strict quality requirements, identification of components that do not comply with the standard one needs to know specific properties of all

components. As Estonian shale oil is mainly used as a blending component in marine fuels, but not only, the need has emerged to define its specification. Specification defined in the standard is based on current data and knowledge taking into account all peculiarities in different shale oil production technologies applied in Estonia.

**Title :** Air quality - Measurement of stationary source emissions - Application of EN ISO/IEC 17025:2017 to periodic measurements  
**Scope :** This document supplements UNI CEI EN ISO/IEC 17025:2017 requirements in order to demonstrate laboratories' competence during periodic measurements of stationary source emissions, including the following steps:  
- the taking of representative samples of emissions and subsequent laboratory analysis for gases and particulate;  
- the determination of reference parameters such as temperature, pressure, water vapour and oxygen content in emissions;  
- the use of portable instruments (such as the ones used in mobile laboratories) in the field.  
This document is applicable to all laboratories undertaking the periodic measurements of stationary source emissions, the calibration of installed automated measuring systems in accordance with UNI EN 14181:2015 and/or field testing of automated measuring systems for conformity assessment purposes.

**Title :** Workplace exposure. Determination of organic vapours in air. Active sampling on activated charcoal tubes, desorption with solvent and analysis by gas chromatography.

---

**Scope :** This standard describes the procedure and equipment for the determination in the airborne at the workplace, through the active sampling on activated charcoal tubes and analysis by gas chromatography (CG), of compounds belonging to the following organic families: aliphatic hydrocarbons, aromatic hydrocarbons, halogenated hydrocarbons, esters, alcohols and ethers, as well as other types of organic vapours that are compatible with sampling in active charcoal tubes and the total or partial use of carbon disulphide as desorption solvent. The procedure of measurement described can be used to carry out measurements to determine the occupational exposure concentration, measurements for comparison with limit values (occupational) to evaluate the exposition via inhalation and periodic measurements. It may also be used to carry out screening measurements of time weighted average concentration (see UNE-EN 482, 4.2) and screening measurements of variation of concentration in space (see UNE-EN 482, 4.3). It cannot be used to measure instantaneous concentrations or fluctuations of the concentration in short periods of time
