**Scope :** his Lithuanian standard specifies methods of determining the all-sided freeze-thaw resistance and one-sided freeze-thaw resistance performing more than 100 freezing and thawing cycles for masonry units which, based on the manufacturer's declaration, are suitable for the application under passive exposure (F0), moderate (F1) or severe (F2) environmental conditions. Freeze-thaw characteristic is described as an ability for a unit to preserve undamaged appearance and shape under alternately freezing and thawing conditions. Deterioration occurring due to freezing and thawing helps to determine freeze-thaw resistance class of clay masonry units.

Title : Classification and packaging of dangerous waste for transport

Scope : This ÖNORM defines requirements for the transport of hazardous waste as dangerous goods in terms of the transport regulations (see ADR, RID and ADN). It serves to classify waste according to these transport regulations and the resulting markings on the packaging or transport units used. Radioactive materials according to the Radiation Protection Act are excluded from the scope of this ÖNORM.  
As the provisions for classification, packagings and entries in the transport document or consignment note (see ADR, RID and ADN) are usually identical, the following only refers to ADR and its structure.  
For packagings in which dangerous goods (waste) are carried, the packaging provisions laid down in the transport regulations apply.  
ADR, RID and ADN also apply to the residual contents of dangerous wastes in packagings.

National Ref : ÖNORM S 2028

Title : Biological ex situ treatment of contaminated soil or soil-like materials

Scope : This ÖNORM specifies requirements for the biological ex-situ treatment of materials, which are contaminated with organic pollutants.  
The objective of this ÖNORM is to ensure that state-of-the-art processes are used and that

---

there is indeed a biological degradation of the pollutants (e.g. hydrocarbons (HC) and polycyclic aromatic hydrocarbons (PAHs)) and not only e.g. a reduction of pollutant concentrations by dilution.

The purpose of biological processes is to supply organically contaminated materials for recycling (recovery procedure R5 (according to AWG 2002), e.g. use as recycled building material) or further treatment (Disposal operation D8 with subsequent operations D1 to D12 (according to AWG 2002), e.g. landfilling, chemical-physical processes).

In the case of contaminated excavated earth or excavated soil material, professional treatment can create the environmental conditions for recycling. The chemical and soil engineering criteria for various treatment purposes are given in the Federal Waste Management Plan 2017.

The end of the waste characteristic occurs immediately with the permitted use of the material. The detailed provisions of the Act on the Remediation of Contaminated Sites regarding exemptions from the obligation to pay contributions for excavated earth and excavated soil materials must also be noted.
