**Scope :** The standard specifies a test method which is part of the procedures described in UNI 8520-22 standard aimed at evaluating the potential alkali-reactivity of concrete aggregates. The detailed petrographic examination consists of a microscopic examination of thin sections. It allows the identification of mineralogical phases and lithotypes of aggregates commonly considered as potentially reactive to alkalis, as well as their content. The standard provides a list of potentially reactive constituents, whose presence, along with the observations on their microstructural and textural properties, contributes to the attribution of the reactivity class. Three examples of the test method application to three Italian aggregates are also reported.
