METHODOLOGICAL INFORMATION

Scope

The scope of the GDP estimate two months after the end of the reference quarter is to provide a better estimate of the growth of Cyprus economy, while providing information on the main variables of the production and expenditure approach.

Compilation and Methodology

QNA are generally constructed using an indirect approach, which is based on short-term indicators providing information on the evolution of the phenomena under study. Furthermore, Chow-Lin's approach technique is used for temporal disaggregation.

The GDP level in Cyprus is determined from the production and expenditure approaches, while the income approach is considered a residual item.

QNA are produced at current, volume and previous-year-prices, published and transmitted to Eurostat at t+2 months. The flash estimate is obtained by running the same estimation procedure as the one applied for the t+2 months calculation however, with less input information available. It is calculated in volume terms at t+45 days, published and transmitted to Eurostat as well.

QNA are compiled in accordance with the European System of Accounts (ESA 2010) as defined in Regulation (EU) No 549/2013 of the European Parliament and of the Council of 21 May 2013.

Source of Data

In order to produce QNA estimates, the following data are used as input to the system of calculation:

- short-term economic indicators by activity,
- administrative data,
- quarterly employment data,
- price indices.
